  - National strategy (UK)

About AI  
and Digital Health  
UNIVERSITY OF LEEDS

May to pledge millions to AI research assisting early cancer diagnosis

Industrial strategy plans to develop artificial intelligence using algorithms built from NHS patient data

Theresa May will pledge millions of pounds of government funding to develop artificial intelligence able to transform outcomes through early diagnosis of cancer and chronic diseases

"The development of **smart technologies** to analyse great quantities of data quickly and with a higher degree of accuracy than is possible by human beings opens up a whole new field of medical research and gives us a new weapon in our armoury in the fight against disease. "Achieving this mission will not only save thousands of lives. It will incubate a whole new industry around AI-in-healthcare, creating high-skilled science jobs across the country, drawing on existing centres of excellence in places like Edinburgh, Oxford and **Leeds** – and helping to grow new ones."

# About AI

About AI...  
"is it a robot?"  
UNIVERSITY OF LEEDS

**FATHERS OF ROBOTICS**  
ISAAC ASIMOV

1. A ROBOT MAY NOT INJURE A HUMAN BEING OR, THROUGH INACTION, ALLOW A HUMAN BEING TO COME TO HARM.
2. A ROBOT MUST OBEY ANY ORDERS GIVEN TO IT BY HUMAN BEINGS, EXCEPT WHERE SUCH ORDERS WOULD CONFLICT WITH THE FIRST LAW.
3. A ROBOT MUST PROTECT ITS OWN EXISTENCE AS LONG AS SUCH PROTECTION DOES NOT CONFLICT WITH THE FIRST OR SECOND LAW.

—ASIMOV'S THREE LAWS OF ROBOTICS

About AI ... intelligence?  
UNIVERSITY OF LEEDS

**Artificial Intelligence (AI)**

- intelligence demonstrated by machines, in contrast to the natural intelligence displayed by humans.
- Computers that mimic "cognitive" functions that humans associate with the human mind, such as "learning" and "problem solving".

**The Turing Test (1950)**

- ability to exhibit intelligent behaviour indistinguishable from that of a human.

*MIND*  
A QUARTERLY REVIEW OF PSYCHOLOGY AND PHILOSOPHY  
L.—COMPUTING MACHINERY AND INTELLIGENCE  
By A. M. TURING

1. The Imitation Game

I propose to consider the question, "Can machines think?" This should begin with definitions of the meaning of the terms "machine" and "think". The definitions might be framed so as to reflect so far as possible the normal use of the words, but this attitude is dangerous. It is necessary to consider the meaning of the words "machine" and "think" as they are used by examining those things are commonly used to illustrate the concepts. The intention is to frame the question in the question, "Can machines think?" so that the answer is a "yes" or "no" question. The question is to be framed in a way which is clearly related to a well understood and relatively unambiguous task.

The two forms of the problem can be described as some of games which we call the "imitation game". It is played with three people, a man (A), a woman (B), and an interrogator (C) in a room of their own. The interrogator stays in a room apart from the other two. The object of the game for the interrogator is to determine which is the man and which is the woman. He knows that B is the man and A is the woman. He asks questions of A and B, and the end of the game is to guess who is the man and who is the woman. The interrogator must not be allowed to hear the answers to his questions. He must not be allowed to see the interrogator. He must not be allowed to see the interrogator.

Alan, M., 1950. Turing. *Computing machinery and intelligence*. *Mind*, 59(236), pp.433-460.

### Let's talk ... About data

UNIVERSITY OF LEEDS

It's the data, dummy.

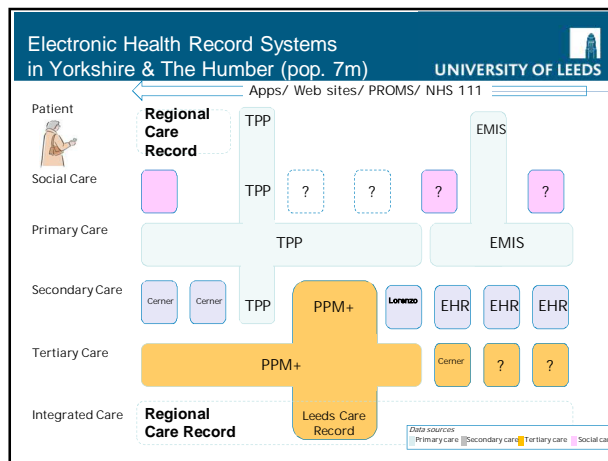

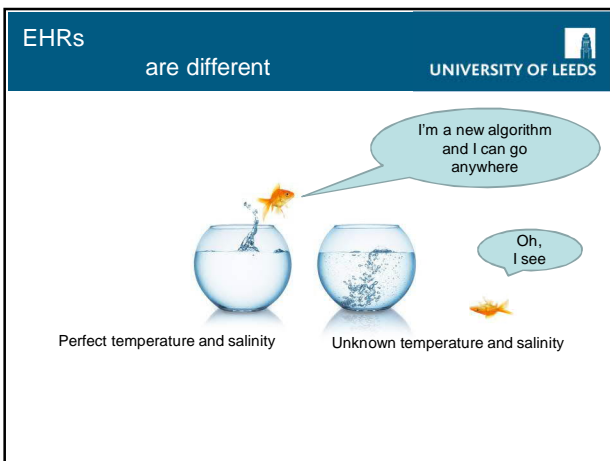

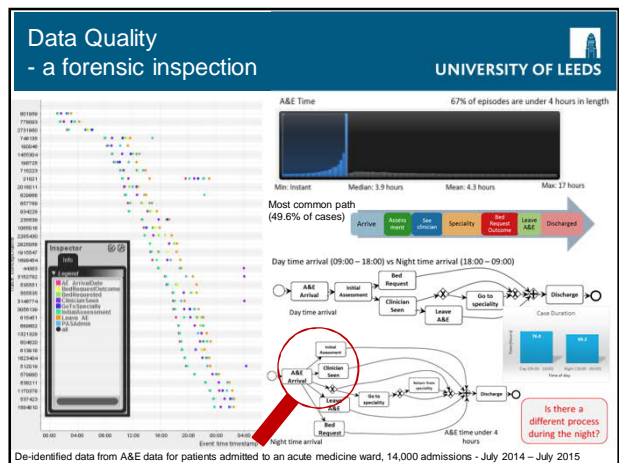

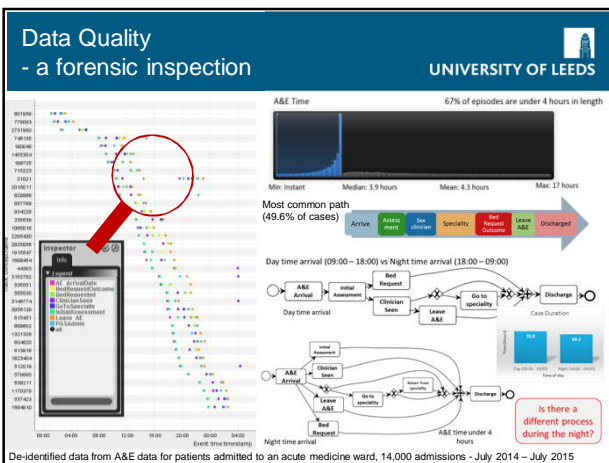

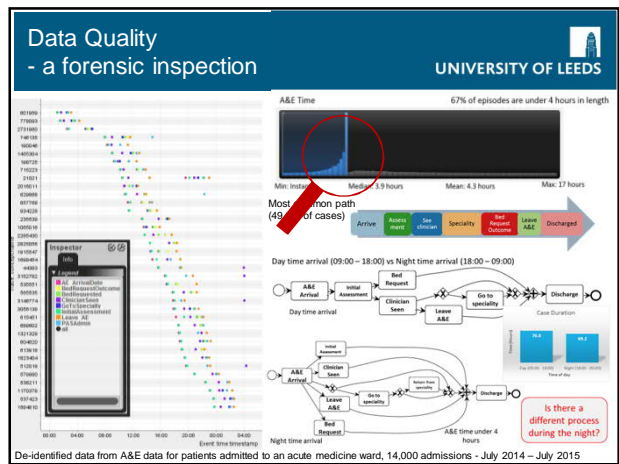

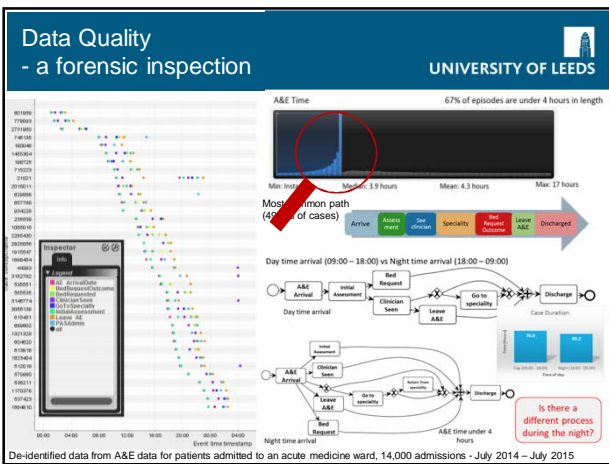

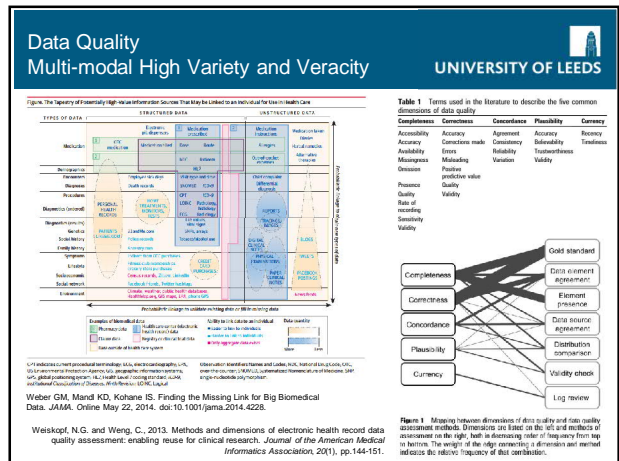

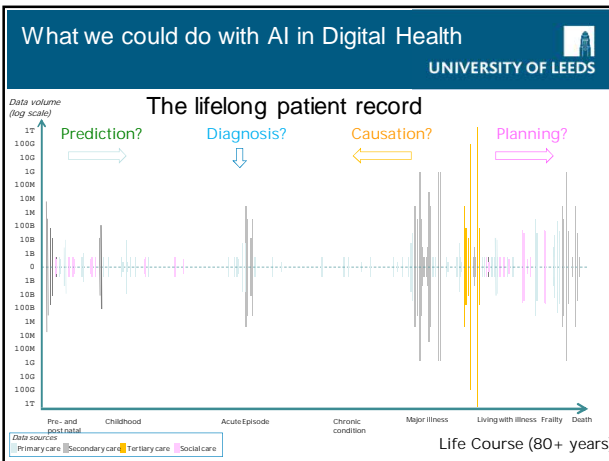

### Bad AI

**NICE Guidance 2015**  
Identifying patients with Cardiovascular Disease (CVD)  
"People should be prioritised for assessment from an estimation of their CVD risk, based on factors already documented in electronic medical records... In order to assess CVD risk for primary prevention, GPs should use the QRISK2 risk calculator for patients up to and including 84 years of age"  
[www.nice.org.uk/news/article/nice-recommends-wider-use-of-statins-for-prevention-of-cvd](http://www.nice.org.uk/news/article/nice-recommends-wider-use-of-statins-for-prevention-of-cvd)

QRISK2 was developed and tested with EMIS  
But SystmOne used different Read codes

6th June 2016  
**Issue with QRISK2 Calculator in SystmOne**  
"The Medicines and Healthcare products Regulatory Agency (MHRA) has instructed TPP practices not to use the QRISK<sup>®</sup>2 Calculator in SystmOne until further notice."

### Cause and effect Change => change => ...

Care decisions

### Let's talk...

UNIVERSITY OF LEEDS

A call to action.

### Three AI threats to Patient Safety

UNIVERSITY OF LEEDS

- 1) The Health Information Systems that an AI sits on are not constants, in fact they are highly variable.
- 2) Historical data that AI is trained on has bias that machines can (and will) learn to replicate.
- 3) The smartest AI can self-learn so will evolve beyond our comprehension (and therefore beyond regulation?).

### UK NHS Code of Conduct

Code of conduct for data-driven health and care technology

Published 18 August 2019

1. Understand users, their needs and the context.
2. Define the outcome and how the technology will contribute to it.
3. Use data that is in line with appropriate guidelines for the purpose for which it is being used.
4. Be fair, transparent and accountable about what data is being used.
5. Make use of open standards.
6. Be transparent about the limitations of the data used.
7. Show what type of algorithm is being developed, or deployed, the ethical examination of how the performance will be validated, and how it will be integrated into health and care provision.
8. Generate evidence of effectiveness for the intended use and value for money.
9. Make security integral to the design.
10. Define the commercial strategy.

[www.gov.uk/government/publications/code-of-conduct-for-data-driven-health-and-care-technology/initial-code-of-conduct-for-data-driven-health-and-care-technology](http://www.gov.uk/government/publications/code-of-conduct-for-data-driven-health-and-care-technology/initial-code-of-conduct-for-data-driven-health-and-care-technology)

### AI and Patient Safety

UNIVERSITY OF LEEDS

- The next five years will see a rapid adoption of AI technologies in diagnostic pathways that hold the promise of faster, cheaper, more effective diagnosis to enable personalised care pathways and treatment.
- AI will get things wrong and make mistakes.
- There are a range of patient safety risks that may emerge as unintended consequences of AI.
- The digital health community is increasingly aware that it must warily embrace AI but a mature discussion on patient safety issues is needed urgently.

It is time for that mature discussion...
